

# PRACTICAL INTRODUCTION TO MATLAB

**Péter Zoltán, CSURCSIA**

MSc in EE & IT

© Péter Zoltán, CSURCSIA  
VUB - ELEC

1 /44

## Outline

- I. Introduction
- II. Matrix algebra in Matlab
- III. Statistics
- IV. Graphical tools
- V. Programming in Matlab
- VI. Signals and systems
- VII. Example

© Péter Zoltán, CSURCSIA  
VUB - ELEC

2 /44

# I.Preface

This practical lecture is designed for doctoral students to get familiar with Matlab. The course is optimized for the spring school on Identification of Nonlinear Dynamic Systems.

This presentation is downloadable from [www.commodos.hu/matlab](http://www.commodos.hu/matlab)

**On this website you can find some source code examples.**

*We wish you a great success and a good luck with Matlab.*

*Labor-instructors of the doctoral school ELEC:*

Dhammika  
Koen  
Maarten  
Péter

*All right reserved. This material can be used only for the department ELEC and for the BME MIT (Budapest). Source is used for this material : [www.mathworks.com](http://www.mathworks.com)*

© Péter Zoltán, CSURCSIA  
VUB - ELEC

3 /44

# I.Important operators and brackets

Character	Function
+	Addition
-	Subtraction
*	Multiplication
/	Division
^	Power
sqrt(number)	Square root of a number
( and )	Parenthesis for mathematical groping and functions
[ and ]	Squared brackets for vectors and matrices

## Examples

```
>> 10+3*(3*2^10)
ans =
9226
```

```
>> sqrt(10+3*(3*2^10))
ans =
96.052069212484952
```

© Péter Zoltán, CSURCSIA  
VUB - ELEC

4 /44

# I.Important constants

name	description
pi	$\pi$
i and j	$\sqrt[2]{-1}$ <b>I strongly advise</b> to use the form "1i" or "1j" and not the form of "1*j" or "1*i" because i and j are often used as variables for "while" or "for" loops. See example below.
realmin, realmax	the smallest and the largest (float) number
inf	Infinity value (IEEE representation)
NaN	Not a Number

## Examples

```
>> pi+3j
ans =
3.1416 + 3.0000i
```

```
>> pi+3i
ans =
3.1416 + 3.0000i
```

# I.Important instructions

## ■ help, example:

```
>> help sum
Name of the instruction
SUM Sum of elements.
S = SUM(X) is the sum of the elements of the vector X. If
X is a matrix, S is a row vector with the sum over each
column. For N-D arrays, SUM(X) operates along the first
non-singleton dimension.
```

## ■ why, examples:

```
>> why
He wanted it that way.
>> why
The programmer suggested it.
>> why
Barney suggested it.
>> why
To please a very terrified and smart and tall engineer.
>> why
The tall system manager obeyed some engineer.
```

## I. Variables: creation and clear

```
>> a=3
a =
3
>> b=2+3i
b =
2.0000 + 3.0000i
>> c=a+b
c =
5.0000 + 3.0000i
>> d=c*sin(pi)
d =
6.1232e-016 +3.6739e-016i
>> who
Your variables are:
a b c d
```

To create variables  
a,b,c,d

The result can be  
expressed in  
exponential form

To check the  
available variables

To clear all variables      To clear variable a      >> clear a

© Péter Zoltán, CSURCSIA  
VUB - ELEC

7 /44

## I. Displaying numbers

```
>> format short
>> pi
ans =
3.1416
>> format long
ans =
3.141592653589793
>> ceil(pi)
ans =
4
>> floor(pi)
ans =
3
>> round(pi)
ans =
3
```

To change to short  
displaying format

To change to long  
displaying format

To get the higher integer part of a number

To get the lower integer part of a number

To round a number to the nearest integer

© Péter Zoltán, CSURCSIA  
VUB - ELEC

8 /44

## II. Vectors and matrices: creation

```
>> [2 4; -1 1+i; 0 2-i]
```

The elements of a vector/matrix must be in square brackets

ans = the result of the operation

2.0000	4.0000
-1.0000	1.0000 + 1.0000i
0	2.0000 - 1.0000i

```
>> A=[1 3; 2 4];
```

Closing an operation with semicolon  
► no "ans =....." result

The name of variable to store the matrix

## II. Vectors and matrices: operations

```
>> A=[1 2 3; 4 5 6; 7 8 9]
A =
1 2 3
4 5 6
7 8 9
```

Example matrices

```
>> B=[1 1 1; 2 2 2; 0 0 0]
B =
1 1 1
2 2 2
0 0 0
```

To add A and B

```
>> A+B
ans =
2 3 4
6 7 8
7 8 9
```

To multiply A with B

```
>> A*B
ans =
5 5 5
14 14 14
23 23 23
```

Complex conjugate of A.  
For simple transpose use A.'

```
>> A'
ans =
1 4 7
2 5 8
3 6 9
```

## II. Vectors and matrices: size and length

```
>> A=[1 2 3 4 5];B=[1;2;3];
```

To create row vector A and column vector B

```
>> C=B*A
```

To create matrix C as product of B and A

```
1   2   3   4   5  
2   4   6   8   10  
3   6   9   12  15
```

```
>> size(C)
```

The size (dimensions) of matrix C

```
ans =
```

3 5

```
>> size(C, 2)
```

```
ans =
```

The number of columns of matrix C

5

```
>> length(C)
```

```
ans =
```

The (maximum) dimension of matrix C

5

## II. Vectors and matrices: referring to elements 1.

Example Matrix

$$\mathbf{A} = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

Element of row  $i$  and column  $j$  ►  $A(i,j)$

$A(3,1)$  ► 7

Element at index  $k$  ►  $A(k)$

$A(1)$  ► 1 |  $A(2)$  ► 4 |  $A(5)$  ► 5

Elements of row  $i$  ►  $A(i,:)$

$A(2,:)$  ► [4 5 6]

Elements of column  $j$  ►  $A(:,j)$

$A(:,3)$  ► [3 6 9]<sup>T</sup>

2<sup>nd</sup> and 3<sup>rd</sup> elements of row 1

$A(1,[2 3])$  ► [2 3]

Each second element

$A(1:2:end)$  ► [1 7 5 3 9]

From the first element

Step size

Till end

## II. Vectors and matrices: referring to elements 2.

Example Matrix

$$\mathbf{A} = \begin{matrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{matrix}$$

```
>> A(end/2:end)
Warning: Integer operands are required for colon operator when used as index
```

```
ans =
5 8 3 6 9
```

```
>> norm(A,2)
```

```
ans =
16.8481
```

```
>> norm(A)
```

```
ans =
16.8481
```

*The middle  
of the  
matrix*

The 'middle':  $9/2=4.5$  is  
not an integer number

## II. Increasing/decreasing sequences

```
>> x=linspace(1,5,3)
```

To create 3 elements of a sequence from 1 to 5

```
x =
1 3 5
```

```
>> x=1:0.5:5
```

To create an increasing sequence  
from 1 to 5 with step size of 0.5

```
x =
```

```
1.0000 1.5000 2.0000 2.5000 3.0000 3.5000 4.0000 4.5000 5.0000
```

```
>> x=5:-2:-5
```

To create a decreasing sequence  
from 5 to -5 with step size of -2

```
x =
```

```
5 3 1 -1 -3 -5
```

## II. Matrices: operations 1.

```
A =
 1   2   3
 4   5   6
 7   8   9
```

Matrix A

---

```
>> rank(A)
ans =
 2
```

To compute the rank of A

---

```
>> cond(A)
ans =
 3.8131e+016
```

To compute the condition number of A

---

```
>> inv(A)
Warning: Matrix is close to singular or badly scaled.
          Results may be inaccurate. RCOND = 1.541976e-018
ans =
 1.0e+016 *
 -0.4504   0.9007  -0.4504
 0.9007  -1.8014   0.9007
 -0.4504   0.9007  -0.4504
```

The inverse is "wrong", because **A** is ill-conditioned

---

```
>> det(A)
ans =
 6.6613e-016
```

To compute the determinant of A

---

```
>> pinv(A)
ans =
 -0.6389  -0.1667   0.3056
 -0.0556   0.0000   0.0556
  0.5278   0.1667  -0.1944
```

To compute the pseudo inverse of A.  
It is the "best" solution for inverse of A.

## II. Matrices: operations 2.

```
A =
 1   2   3
 4   5   6
 7   8   9
```

Definition of Matrix A

---

```
>> A^2 % is equal to A*A
 30   36   42
 66   81   96
102  126  150
```

Matrix A to the power two

---

```
>> A.^2 % element by element powering
 1    4    9
 16   25   36
 49   64   81
```

The dot operator is the **element by element operation**. Here it is the powering

---

```
>> sum(A)
12   15   18
```

To compute sums of columns

---

```
>> prod(A)
28   80   162
```

To compute products of columns

If the input parameter is a vector, then it returns a scalar value

## II. Matrices: special types

```
>> zeros(2,2)
ans =
0 0
0 0
```

To create a null matrix

```
>> ones(2,2)
ans =
1 1
1 1
```

To create a matrix of ones

```
>> eye(2,2)
ans =
1 0
0 1
```

To create an identity matrix

## II. Matrices: remove a row/column

```
>> X=[2 -1 0 -3;5 6 7 8]
X =
2      -1      0      -3
5       6      7       8
```

Definition of Matrix X

```
>> X (:, 3) = []
X =
2      -1      -3
5       6       8
```

To remove the third column

## II. Matrices: add/change a row/column

```
>> X=[2 -1 0 -3; 5 6 7 8]
```

X =

2	-1	0	-3
5	6	7	8

Definition of Matrix X

```
>> X=[X; 0 0 0 0]
```

X =

2	-1	0	-3
5	6	7	8
0	0	0	0

To add a new row after the last one

```
>> X(2,:)=[9 9 9 9]
```

X =

2	-1	0	-3
9	9	9	9
0	0	0	0

To change the second row

## II. Matrix: a complex example

```
>> A=1:2:3;
>> B=zeros(1,3);
>> C=rand(2);
>> D=randn(2,3);
>> E=[A B;C D]
```

E =

1.0000	3.0000	0	0	0
0.9501	0.6068	-0.4326	0.1253	-1.1465
0.2311	0.4860	-1.6656	0.2877	1.1909

## III. Statistical functions

Function	Description
max(V) or max(M)	<ul style="list-style-type: none"> <li>max/min/mean/median(V) means that we compute this quantities for the vector V and the result is a scalar value</li> </ul>
min(V) or min(M)	<ul style="list-style-type: none"> <li>max/min/mean/median(M) means that we compute this quantities for the matrix M and the result is a row vector which consists of the max/min/mean/median of the columns of M</li> </ul>
mean(V) or mean(M)	
median(V) or median(M)	
std(V) or std(V,1)	<ul style="list-style-type: none"> <li>std(V)/var(V) means the <u>unbiased</u> standard deviation/variance of the vector V.</li> </ul>
var(V) or var(V,1)	<ul style="list-style-type: none"> <li>std(V,1)/var(V,1) is the <u>biased</u> standard deviation/variance of the vector V.</li> </ul>
cov(V) or cov(M1,M2)	<ul style="list-style-type: none"> <li>cov(V) is equal to var(V)</li> <li>cov(M1,M2) is the covariance matrix of matrices M1 and M2</li> </ul>
rand(N,M)	<ul style="list-style-type: none"> <li>rand(N,M): returns a matrix with N rows and M columns with uniformly distributed random values between 0 and 1</li> </ul>
randn(N,M)	<ul style="list-style-type: none"> <li>randn(N,M): returns a matrix with N rows and M columns with standard normally distributed random values</li> </ul>

## III. Statistical functions: example 1

```
>> n=1+2.*randn(10000,1);
```

To create a normally distributed random sequence with mean of 1 and standard deviation of 2.

**Remark:** 2.\*randn(10000,1) means that we get a column vector of 10000 random values and we multiply them 'element by element' with 2

```
>> mean(n)
```

ans = 1.0097 To compute the mean value

```
>> std(n)
```

ans = 1.9814 To compute the unbiased standard deviation

```
>> var(n)
```

ans = 3.9258

The empirical histogram of the vector n plotted in 20 intervals

```
>> cov(n)
```

ans = 3.9258 To compute the unbiased variance with the help of the covariance function

>> hist(n,20)

### III.Statistical functions: example 2

```
>> n=2*pi+(4*pi-2*pi).*rand(100000,1); To create a uniformly distributed random sequence
>> var(n) between [2π ,4π ]
ans =
3.2815
To compute the unbiased variance with the help of the covariance function
```

```
>> std(n)
ans =
1.8115
To compute the unbiased standard deviation
```

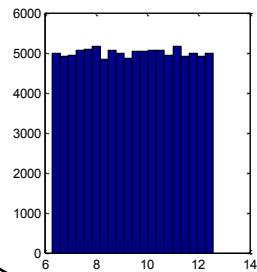

```
>> mean(n)
ans =
9.4240
To compute the mean value
```

```
>> median(n)
ans =
9.4305
To compute the median value
```

The empirical histogram of the vector  $n$  plotted in 20 intervals

$\gg hist(n,20)$

### IV.Graphical functions 1.

Function	Description
plot(Y)	<ul style="list-style-type: none"> <li>plot(Y) plots the values of vector Y</li> </ul>
plot(X,Y)	<ul style="list-style-type: none"> <li>plot(X,Y) plots vector Y versus vector X</li> </ul>
plot(X,Y,s)	<ul style="list-style-type: none"> <li>plot(X,Y) plots vector Y versus vector X with visualization parameters, see later on</li> </ul>
stem(Y)	<ul style="list-style-type: none"> <li>They plot the data sequence Y as stems from the x axis terminated (with circles) for the data value.</li> </ul>
stem(X,Y)	
stem(X,Y,s)	
figure	<ul style="list-style-type: none"> <li>figure: create a new window for plotting</li> <li>figure(number_identifier): a new window with this identifier in the title part of the window</li> </ul>
figure(number_identifier)	
hist(V)	<ul style="list-style-type: none"> <li>To make a histogram of vector V</li> <li>To make a histogram of vector V in n bins</li> </ul>
hist(V,n)	
hold on	<ul style="list-style-type: none"> <li>To hold the actual canvas for other new plots</li> <li><b>default:</b> if you plot a new function the old one will be erased</li> </ul>

## IV.Graphical functions 2.

Function	Description
subplot(n,m,p)	▪ It breaks the actual canvas into an m-by-n matrix of small axes, selects the p-th axes for the current plot, and returns the axes handle.
title(string)	▪ It sets a title of the current plot
xlabel(string)	▪ To set the label text of axis X and Y
ylabel(string)	▪ To set the label text of axis X and Y
axis([XMIN XMAX YMIN YMAX])	▪ It sets scaling for the x- and y-axes on the current plot.
legend(string1,string2,...)	▪ It puts a legend on the current plot.
grid on	▪ To set the grid on the current plot
semilogx(X,Y,s)	▪ They are the same as plot() except a logarithmic (base 10) scale is used for the X/Y/X and Y-axis.
semilogy(X,Y,s)	▪ They are the same as plot() except a logarithmic (base 10) scale is used for the X/Y/X and Y-axis.
loglog(X,Y,s)	▪ They are the same as plot() except a logarithmic (base 10) scale is used for the X/Y/X and Y-axis.
close all	▪ To close all the figure-windows
mesh(X,Y,Z)	▪ To plot 3D figures
surf(X,Y,Z)	▪ To plot 3D figures

## IV.Graphical functions -Plot

Various line types, plot symbols and colors may be obtained with PLOT(X,Y,S) where S is a character string made from one element from any or all the following 3 columns:

b	blue	.	point	-	solid
g	green	o	circle	:	dotted
r	red	x	x-mark	-.	dashdot
c	cyan	+	plus	--	dashed
m	magenta	*	star	(none)	no line
y	yellow	s	square		
k	black	d	diamond		
w	white	v	triangle (down)		
		^	triangle (up)		
		<	triangle (left)		
		>	triangle (right)		
		p	pentagram		
		h	hexagram		

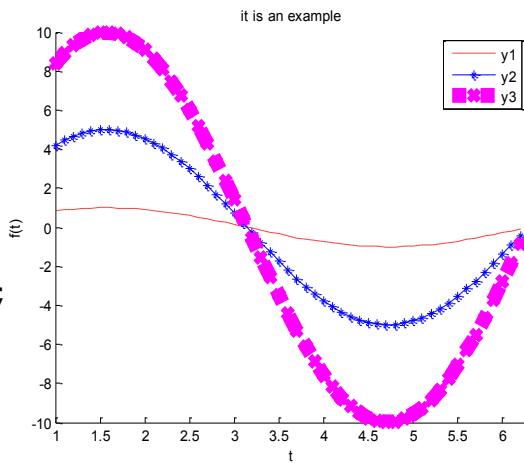

For example, PLOT(X,Y,'c+:') plots a cyan dotted line with a plus at each data point; PLOT(X,Y,'bd') plots blue diamond at each data point but does not draw any line.

## IV. Graphical functions –Example 1.

**DO IT YOURSELF  
LINE BY LINE AND SEE THE RESULTS**

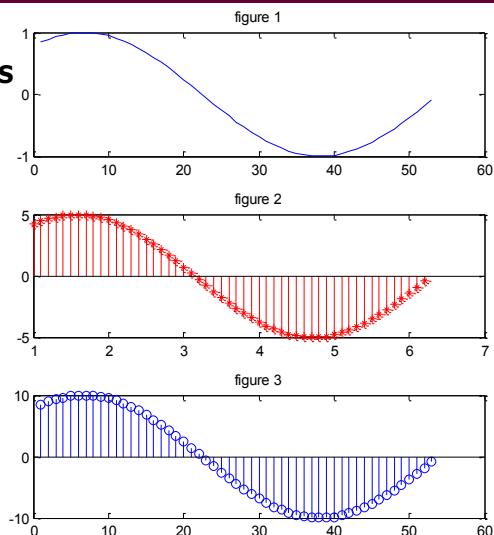

```
figure(10);
x=[1:0.1:2*pi];
y1=sin(x);
y2=5*sin(x);
y3=10*sin(x);
hold on;
plot(x,y1,'r--');
plot(x,y2,'b*-');
plot(x,y3,'mx:','LineWidth',10);
legend('y1','y2','y3');
title('it is an example');
xlabel('t');
ylabel('f(t)');
axis([1 2*pi -10 10]);
```

## IV. Graphical functions –Example 2.

**DO IT YOURSELF  
LINE BY LINE AND SEE THE RESULTS**

```
subplot(3,1,1);
plot(y1);
title('figure 1');
subplot(3,1,2);
stem(x,y2,'r*');
title('figure 2');
subplot(3,1,3);
stem(y3);
title('figure 3');
```

## V.Programming in Matlab

- The programming language of Matlab is similar to C
- You can easily define scripts and functions
- You can use ***if/for/while/switch*** which should be closed by ***end***

- 
- To get an input data from the keyboard use the instruction ***input***
  - To display an information use ***display*** and ***sprintf***
  - To make an online debugging in a function/script use the instruction ***keyboard***
  - **See the examples later on**

## V.Create a function/script

It behaves like a normal script written in the console

The file name of the function must be the same as the name of the function!

```
function [ output_args ] = NameOfFunction( input_args )
% NameOfFunction Summary of this function goes here
% Detailed explanation goes here
...
end
```

### EXAMPLE:

```
function [ c ] = Add(a,b)
% ADD To add two numbers together
% Add(a,b) will return with c=a+b
c=a+b;
end
```

```
>> Add(2,3) >> help Add
ans =                                ADD To add two numbers together
5                                     Add(a,b) will return with c=a+b
```

## V. Control structures

```
if (expression1)
    instructions...
elseif (expression2)
    instructions...
else
    instructions...
end
```

```
y=rand(1,1)
if(y<0)
    display('it is negative');
else
    display('it is positive');
end;
```

### Example

```
>> y=rand(1,1)
|
y =
0.3852

>> if(y<0)
display('it is negative');
else
display('it is positive');
end;
it is positive
```

The result of the script

## V.Loops

```
switch(variable)
case value1
    instructions...
case value2
    instructions...
otherwise
    instructions...
end
```

```
while(expression to be true)
    instructions...
end
```

```
for variable=starter_value:incrementer:end_value
    instructions...
end
```

### Modifiers

**continue:** it jumps to the beginning of while/for

**break:** it leaves immediately the loop

## V. Conditional operators

Operator	Description
<	Less than
<=	Less than or equal to
>	Greater than
>=	Greater than or equal to
==	Equal to
~=	Not equal to

Logical Operation	Equivalent Function
A & B	and(A, B)
A   B	or(A, B)
~A	not(A)

Use them for vectors

Use them in  
expressions of for/while

Operator	Description
&&	Returns logical 1 (true) if both inputs evaluate to true, and logical 0 (false) if they do not.
	Returns logical 1 (true) if either input, or both, evaluate to true, and logical 0 (false) if they do not.

## V. Source code example – the code

```
display('Please choose one of the following possibilities');
display('Type 1 if you want to see a while loop with integer numbers');
display('Type 2 if you want to see a for loop with float numbers');
display('Type something else to exit');
menu=input('your preference:');
switch(menu)
    case 1
        i=0;
        while(i<10)
            display(sprintf('Actual value of i is now %i',i));
            i=i+1;
        end;
    case 2
        for i=0:0.1:1
            display(sprintf('Actual value of i is now %f',i));
        end;
    otherwise
        display('Bye-bye my friend');
    end;
```

To input a number

It sets to  
'int'

It sets to  
'float'

## V. Source code example - result

Please choose one of the following possibilities

Type 1 if you want to see a while loop with integer numbers

Type 2 if you want to see a for loop with float numbers

Type something else to exit

your preference:1

Actual value of i is now 0

Actual value of i is now 1

Actual value of i is now 2

Actual value of i is now 3

Actual value of i is now 4

Actual value of i is now 5

Actual value of i is now 6

Actual value of i is now 7

Actual value of i is now 8

Actual value of i is now 9

your preference:2

Actual value of i is now 0.000000

Actual value of i is now 0.100000

Actual value of i is now 0.200000

Actual value of i is now 0.300000

Actual value of i is now 0.400000

Actual value of i is now 0.500000

Actual value of i is now 0.600000

Actual value of i is now 0.700000

Actual value of i is now 0.800000

Actual value of i is now 0.900000

Actual value of i is now 1.000000

your preference:3

Bye-bye my friend

## V.Load and save the workspace

% Save the workspace (all variables) from the workspace to test.mat:  
***save test.mat***

## V.Operator Precedence

1. Parentheses ()
2. Transpose ('), power (.^), complex conjugate transpose ('), matrix power (^)
3. Unary plus (+), unary minus (-), logical negation (~)
4. Multiplication (\*), right division (/), left division (\), matrix multiplication (\*), matrix right division (/), matrix left division (\)
5. Addition (+), subtraction (-)
6. Colon operator (:)
7. Less than (<), less than or equal to (<=), greater than (>), greater than or equal to (>=), equal to (==), not equal to (~=)
8. Element-wise AND (&)
9. Element-wise OR (|)
10. Short-circuit AND (&&)
11. Short-circuit OR (||)

## VI.Signals and Systems in Matlab 1.

Function	Description
SYS = tf(num,den)	<ul style="list-style-type: none"> <li>▪ <code>tf(num,den)</code> creates a continuous-time transfer function SYS with numerator num and denominator den</li> <li>▪ <code>tf(num,den,Ts)</code> creates a discrete-time transfer function SYS with numerator num and denominator den with sampling time Ts.</li> </ul>
impulse(SYS)	<ul style="list-style-type: none"> <li>▪ it returns/plots the impulse response of the dynamic system SYS</li> </ul>
step(SYS)	<ul style="list-style-type: none"> <li>▪ it returns/plots the step response of the dynamic system SYS</li> </ul>
lsim(SYS,U,T)	<ul style="list-style-type: none"> <li>▪ it returns/plots the time response of the dynamic system SYS to the input signal described by U and T</li> </ul>
bode(SYS)	<ul style="list-style-type: none"> <li>▪ it draws the Bode plot of the dynamic system SYS.</li> </ul>
db(x)	<ul style="list-style-type: none"> <li>▪ <math>20 \cdot \log_{10}(\text{abs}(x))</math></li> </ul>

## VI.Signals and Systems in Matlab 2.

Function	Description
filter(B,A,u)	<ul style="list-style-type: none"> <li>it returns filtered data to the input u. The filter described by vectors A and B</li> </ul>
[X]=fft(x)	<ul style="list-style-type: none"> <li>they compute the discrete Fourier/ inverse Fourier transform (DFT) of vector X</li> </ul>
[x]=ifft(X)	<ul style="list-style-type: none"> <li>Fft: the first element of returned array is the DC value!</li> </ul>
[Gest]=tfestimate(u,y)	<ul style="list-style-type: none"> <li>it estimates the transfer function, u and y are time-discrete input and output data (vectors)</li> </ul>
[H,W] = freqz(B,A,n)	<ul style="list-style-type: none"> <li>it returns the n-point complex frequency response vector H and the N-point frequency vector W in radians/sample in freqz case and radians/sec in freqs case of the filter. See also filter</li> </ul>
[H,W] = freqs(B,A)	
[Sxy]=cpsd(x,y)	<ul style="list-style-type: none"> <li>It returns the cross power spectral density function of time discrete data x and y</li> </ul>
repmat(A,m,n)	<ul style="list-style-type: none"> <li>creates a large matrix consisting of an m-by-n tiling of copies of A</li> </ul>

## VI.Example: step response of a system

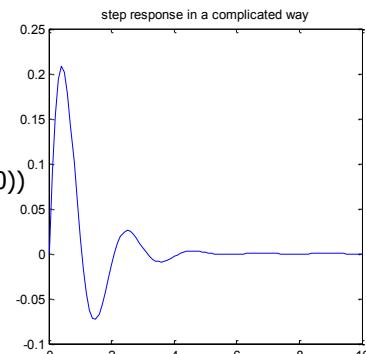

```
>> h=tf([1 0],[1 2 10])
```

Transfer function:

$$\frac{s}{s^2 + 2s + 10}$$

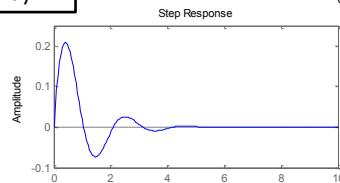

Complicated way

```
plot(0:0.1:10,lsim(h,ones(1,length(0:0.1:10)),0:0.1:10))
title('step response in a complicated way');
```

Easy way

```
>> step(h,10)
```

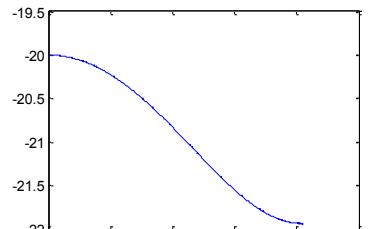

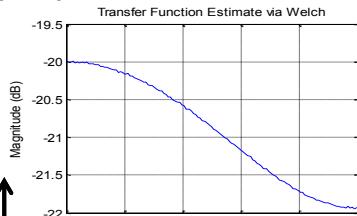

## VI.Example: Estimating a transfer function

Transfer function:

1

The system to demonstrate in 's' domain

$s + 10$

```

h=tf([1],[1 10]) %to define h
u=randn(10440,1);%to generate the input signal
u_sim=repmat(u, 2); %to make two periods, it is equivalent to u=[u;u]
y_sim=lsim(h,u_sim,0:length(u_sim)-1); %to compute on the whole domain
y_meas=y_sim(end/2+1:end); %to skip the first period which may contain transients
tfestimate(u,y_meas); %to plot the frequency response function FRF estimate
%plot(db(cpsd(u,y_meas))./cpsd(u,u))) // THE NORMAL WAY TO COMPUTE THE FRF

```

## VI.Example: Estimating a transfer function cont'd.

```

H=db(fft(y_meas)./fft(u));----- To compute the FRF in the 'shorter' way
%H=20*log10(abs(fft(y_meas)./fft(u)));
plot(linspace(0,0.5,length(u)/2),H(1:end/2));----- To compute the FRF in the 'normal' way

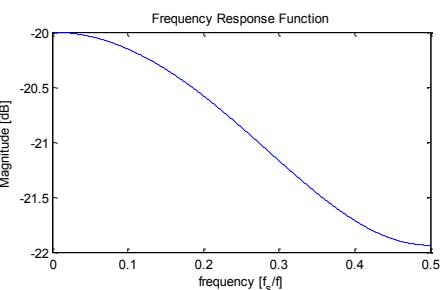

```

xlabel('frequency [f\_s/f]'); ylabel('Magnitude [dB]');

title('Frequency Response Function');

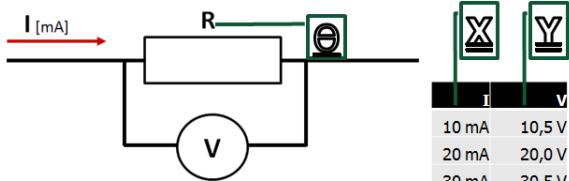

**This solution can be used with  
restrictions only!**

Think it over e.g. what happens if the U (fft(u)) contains zero value

## VI.Example: Least Squares solution

This example is solved by LS in matrix form.  
The parameter to estimate is  $\theta$  (**R**).  
The observation matrix is X (I) and  
the system output is Y (V).

```
>> X=[10/1000 20/1000 30/1000 40/1000];
>> Y=[10.5 20 30.5 39];
```

$$\hat{\theta}_{LS} = \hat{R}_{LS} = [X^T X]^{-1} X^T Y$$

Inverse can be problematic...

```
>> inv(X'*X)*X'*Y
ans =
993.3333
```

\ also solves the equation  
but with help of QR  
decomposition and  
it is better conditioned

```
>> X\Y
ans =
993.3333
```

The analytical way

$$\hat{R}_{LS} = \frac{\sum XY}{\sum X^2} = \frac{\sum VI}{\sum I^2}$$

```
>> (X'*Y)/(X'*X)
ans =
993.3333
```

*„It is not because things are difficult that we do not dare,  
it is because we do not dare that they are difficult.”*
